## 3.3 Setting up the quadratic minimization: clustering

Let  $E = \{x_1 < x_2 < x_3\}$ . We set

$$\delta_{ij} = |x_i - x_j|$$

We can assume  $\delta_{ij} \leq 1$ .

Given a triple of linear polynomials  $(p_1, p_2, p_3), p_j(x) = k_j(x - x_j) + b_j$  we identify

$$(3.8) (p_1, p_2, p_3) \sim (b_1, k_1, b_2, k_2, b_3, k_3) \in \mathbb{R}^6.$$

The Whitney norm on the triple  $(p_1, p_2, p_3)$  is

The key matrix is given by:

(3.10) 
$$L_{\text{cluster}}(p_1, p_2, p_3) = \begin{pmatrix} \delta_{21}^{-2}(b_1 - b_2) + \delta_{21}^{-1}k_2 \\ \delta_{32}^{-2}(b_2 - b_3) + \delta_{32}^{-1}k_3 \\ b_3 \\ \delta_{21}^{-1}(k_1 - k_2) \\ \delta_{32}^{-1}(k_2 - k_3) \\ k_3 \end{pmatrix}.$$

**Problem 3.** Write out  $L_{\text{cluster}}$  in the basis  $(b_1, k_2, b_2, k_2, b_3, k_3)$  (the coefficients should only consist of combinations of  $\delta_{ij}$ ). Compute  $L_{\text{cluster}}^{-1}$ .

Let  $\varphi: E \to [0, \infty)$  be some given data. We define  $L_{\varphi}$  by

(3.11) 
$$L_{\varphi} = \left(0, \frac{k_1}{2\sqrt{\varphi(x_1)}}, 0, \frac{k_2}{2\sqrt{\varphi(x_2)}}, 0, \frac{k_3}{2\sqrt{\varphi(x_3)}}\right)$$

when  $\varphi > 0$ . When  $\varphi(x_j) = 0$  for some  $x_j$ , we set  $k_j = 0$ .

Let  $\beta = L_{\text{cluster}}(p_1, p_2, p_3)$ . The quadratic minimization problem is

Minimize 
$$||L_{\varphi}\beta||_{\ell_2}^2 + ||\beta||_{\ell_1} = \beta^t A \beta + ||\beta||_{\ell_1}$$
.

(3.12) Subject to 
$$VL_{\text{cluster}}^{-1}\beta = \begin{pmatrix} \varphi(x_1) \\ 0 \\ \varphi(x_2) \\ 0 \\ \varphi(x_3) \\ 0 \end{pmatrix}$$

Here is the dictionary:

- $\bullet \ A = L_{\varphi}^t L_{\varphi}.$
- V = diag(1, 0, 1, 0, 1, 0). It fixes the function value.

• 
$$B = VL_{\text{cluster}}^{-1}$$
 and  $b = \begin{pmatrix} \varphi(x_1) \\ 0 \\ \varphi(x_2) \\ 0 \\ \varphi(x_3) \\ 0 \end{pmatrix}$ .

Finally, let  $\beta_*$  be the minimizer of the problem above. We can find the slope  $(k_1, k_2, k_3)$ :

$$(0, k_1, 0, k_2, 0, k_3) = L_{\text{cluster}}^{-1} \beta_*$$

If you have time, consider the new triple of quadratic polynomials  $(\tilde{p}_1, \tilde{p}_2, \tilde{p}_3)$  associated with the data  $\varphi$ , given by

$$\tilde{p}_j(x) = \frac{k_j^2}{4\varphi(x_j)}(x - x_j)^2 + k_j(x - x_j) + \varphi(x_j),$$

where  $k_j$  are solved as above. Patch them together using the old technique.

Problem 4. Given data

- $E = \{0, 0.2, 1\},$
- $\varphi(0) = 4$ ,  $\varphi(0.2) = 0$ ,  $\varphi(1) = 1$ .

Find a nonnegative interpolant on [-1,2] using all the techniques.
